

Information Management for Business Success

Designed to bring your construction teams together like never before!

In today's construction environment, project teams are forced to deal with tight schedules, administrative hassles, and growing communication gaps. Add to this the fact that these teams are expected to get the job done on time and on budget and the pressure is on from day one. Whether constructing a new retail store chain, re-routing a major highway, or renovating an office building, teams have to meet deadlines - without exception! Now consider that most AEC teams today include Engineers, Architects, and Contractors from different companies working from multiple locations, and often in different time zones, and your pressure has now turned into a real problem. With all this complexity, how can you possibly get the job done, let alone on time and on budget?

The answer is simple - InQuest Construction. InQuest Construction is the leading web-based collaboration and document management platform built specifically for Architects, Engineers, Contractors and Owners to help them manage the thousands of documents and complex communications of modern construction projects. It's a user-friendly solution that unites project teams quickly and easily, ensuring that everyone is working with the correct information, when they need it. You always know who has what files, which tasks need to be completed, what the job site's looking like and more. It's all there inside InQuest Construction, available for your team at the click of a button, any time of day, from anywhere in the world.

Available as an in-house or as a hosted solution, InQuest Construction is a true turnkey application. Simply point your browser to your InQuest Construction web site and your team has access to the information and workflow tools they need, from project initiation to project completion and beyond. With its browser-based interface, customizable project structure, powerful document management features, and robust security framework, InQuest Construction provides a flexible and highly functional solution that's familiar to your project team the moment they log on. It's the perfect way to manage critical documents, coordinate schedules, track tasks, address RFIs, deliver submittals and more. InQuest Construction helps you get the job done - ahead of schedule and under budget.

- *Best Practice Templates*
- *Unlimited Users & Projects*
- *Customizable Interface*
- *Multi-Role Security*
- *Seamless Desktop Integration*
- *Event Driven Notifications*
- *Anytime, Anywhere Access*

Exchange more than just files; exchange information! InQuest Construction was designed with AEC professionals in mind and offers flexible workflow automation tools including:

Requests For Information (RFIs) - Electronic RFIs allow team members to get the required information when it's needed! User responses can include attached files and 3rd party comments or suggestions with everything tracked for a complete audit trail.

Requests For Approval (RFAs) - The system's RFAs deliver a quick and easy online form to get approvals from appropriate team members. Users can also attach files to RFIs making them ideal for approving timesheets, payment request, contract revisions and more.

Bid Manager - Provides real-time management of the complete Bid and RFP process with the ability to assign project team members or vendors through an easy to use interface. Once a bid is created, the entire response, review, tracking and award cycle is accomplished securely in real-time through the system.

Submittals - Create digital submission sets of files and distribute them to other project team members. Once a Submittal is issued, the entire process of tracking who has received them, reviewed them and when, is available online.

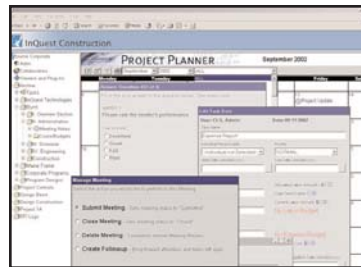

Meeting Manager - Users can schedule meetings, invite attendees, take roll, include meeting information, and even attach files. This information then serves as an online catalog of meeting minutes where users can review information about the meeting, assign tasks and even create follow up action items.

Surveys - Online questionnaires that allow you to dynamically create and post surveys for other InQuest Construction users to answer. Once the survey is completed, the results are stored securely for later review, discussion, or analysis and can be stored as templates for future use.

Transmittals - Digital transmittals give users the flexibility to record all transactions. Whether it's faxed, sent overnight express, or via courier, InQuest Construction captures all the information for complete audits and review.

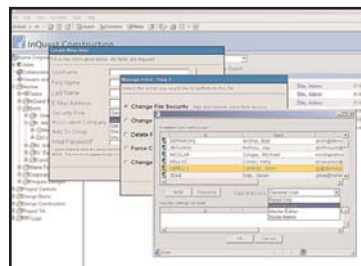

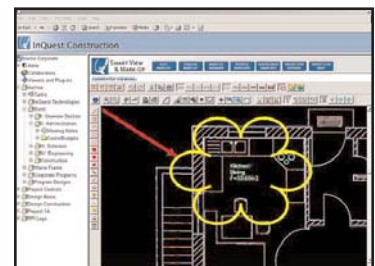

Task and Action Items - With online tasks and action items, users can quickly create and track assignments at the click of a mouse. Monitoring capabilities include assignment status, expense reporting, budget tracking and schedule updating and completion percentage.

Document Management - Store unlimited documents in secure file vaults complete with direct routing and check-in/check-out capabilities. Each vault offers full version control, history and multi-file uploads and downloads - all with event driven email notifications so you're always up to date on associated files.

Customizable "Look & Feel" - Apply user-defined skins to display project information in the way you want to see it, creating a system that works for you, not against you. All screens and information display your corporate identity and reinforce your brand.

Built-In File Viewer - View and redline over 250 different file types, including DWGs, DGNs, GIFs, JPGs and more directly within InQuest Construction, even without the file's native application installed. Strict security settings even allow you to select which team members get to view markups and changes.

Comprehensive Security - With flexible security features, you control user access at every level - right down to the file level. Once the system's security takes over, you can guarantee that users only have access to authorized information, and nothing else.
